1. Executive Summary

FlashMan at a Glance

FlashMan is a cutting-edge, web-based crowd participation platform that transforms every smartphone in an audience into a synchronized flashlight — creating stunning, coordinated light shows at live events. No app download is required. Attendees simply scan a QR code or enter a PIN in their browser and instantly become part of the show.

Mission Statement

To make every live event unforgettable by turning the audience into the performance — one flash at a time.

Why FlashMan Exists

Traditional light shows require expensive hardware, trained operators, and complex setups. FlashMan eliminates all of that. The host uses a simple web dashboard to control thousands of audience phones simultaneously — creating coordinated flash effects, strobes, pulses, and music-synchronized light shows — all in real time, with zero hardware beyond the phones already in people's pockets.

Key Highlights

- Works on any smartphone browser — iOS, Android, no app download required
- Real-time synchronization within milliseconds using WebSocket technology
- Music-synchronized flashlight effects using custom JSON timing files
- Supports unlimited attendees simultaneously
- QR code joining — attendees join in seconds by scanning
- Screen flash fallback for devices without a physical torch
- Multiple event management from a single host account
- Visual timing preview for pre-show preparation
- Live progress bar and "Now Playing" banner for attendees

Business Opportunity

The global event technology market is valued at over \$30 billion USD and growing at 11% annually. FlashMan addresses an underserved niche — affordable, interactive crowd participation technology — with a product that is already built, tested, and ready to deploy.

2. Product Overview

What FlashMan Does

FlashMan is a two-sided platform consisting of a Host Controller and an Attendee Experience, both accessible through a standard web browser on any device.

The Host Side

The host (event organizer, DJ, performer) accesses the FlashMan dashboard on their phone or tablet. From here they can:

- Create an event and receive a unique 9-character PIN and QR code
- Control live flashlight effects across all connected attendees instantly
- Upload songs paired with custom JSON timing files for automated light shows
- Monitor how many attendees are connected in real time
- Stop all effects immediately with a single button

The Attendee Side

Attendees (audience members) open their phone browser and either scan the QR code or enter the 9-character PIN. After granting camera permission, their phone becomes part of the synchronized light show. They see:

- Connection status and event name
- "Now Playing" banner showing the current song
- Visual indicator when an effect is active
- Automatic screen flash if their device does not support torch

How It Works — Step by Step

1. Host creates an event on FlashMan and receives a unique PIN and QR code
2. Host shares the QR code on a projector screen or sends the PIN via message
3. Attendees scan the QR code or type the PIN in their browser
4. Attendees tap "Enable Flashlight" to grant camera permission
5. Host presses FLASH, STROBE, or PULSE — all phones respond within milliseconds
6. Host plays a song — flashlights follow the pre-programmed timing automatically
7. Host presses STOP ALL to end the effect instantly across all devices

3. Core Features

Complete Feature Set

Live Effect Controls

Feature	Description	Audience Impact
FLASH / TORCH ON	Turns all flashlights ON simultaneously	Instant bright flash across crowd
STROBE	Rapid on/off at 1–20 Hz, adjustable	Pulsing strobe effect
PULSE ONCE	Single short burst of light	One-time attention pulse
STOP ALL	Turns off all effects immediately	Instant crowd reset
Screen Flash	White screen fallback for unsupported devices	All devices participate

Music Synchronization

Feature	Description
JSON Timing Upload	Upload a file specifying exact flash on/off times
Song + JSON Pairing	Each song is paired with its own timing file
Multi-Section Upload	Add multiple song+timing pairs per event
Progress Bar	Live playback progress shown while song plays
Visual Timeline	Preview timing events as a dot chart before playing
Stop Button	Stop song and all effects instantly during playback

Event Management

Feature	Description
Event Creation	Create events in seconds with auto-generated credentials
Multiple Events	Host multiple events; all saved to device history
QR Code	Scannable QR for instant attendee joining
Host Re-login	Re-enter any past event using Event ID + Password
Participant Counter	Live count of active and total attendees

My Events List

--

Home screen shows all past events for quick access

4. Music Synchronization System

The Heart of FlashMan's Light Show

FlashMan's music sync system is what separates it from basic flashlight apps. It allows a show producer to pre-program exactly when each flashlight in the crowd should flash, dim, or pulse — down to the millisecond — synchronized perfectly with the music.

How the JSON Timing System Works

Instead of relying on audio analysis (which can be unreliable), FlashMan uses a human-crafted or tool-generated JSON file that explicitly defines every flash event. This gives complete creative control to the operator.

JSON File Format

flashlight_timing.json

```
[
  { "time": 0,   "action": "on" },
  { "time": 500, "action": "off" },
  { "time": 1200, "action": "on" },
  { "time": 1800, "action": "off" }
]
```

Upload Workflow

1. Open the Music Sync Library on the Host Dashboard
2. Click "Add Section" to create a new song slot
3. Upload the audio file (MP3, WAV, AAC — up to 50MB)
4. Upload the matching JSON timing file
5. Click "Upload Section" — both files are saved together
6. Press Play on the song card when ready to perform
7. All attendee flashlights follow the timing automatically

Visual Timeline Preview

Before performing, the host can click the clock icon on any song to open the Visual Timeline. This shows every flash event as a colored bar on a horizontal timeline — purple for torch-ON, dim for torch-OFF. This lets the operator verify the timing visually before going live in front of an audience. A playhead moves across the timeline in real

time during playback.

Multiple Song Sections

FlashMan supports unlimited song sections per event. A show can contain 10, 20, or more songs — each with its own timing file. The host switches between songs during the event, and attendees automatically sync to whichever song the host triggers.

Producer Tip

Use music production software (like GarageBand or Audacity) to mark beat positions, then export those timestamps as your JSON timing file for perfect beat-accurate flashlight synchronization.

5. Real-Time Communication Technology

Speed & Synchronization

The defining technical achievement of FlashMan is its ability to synchronize flashlight effects across hundreds or thousands of devices within milliseconds. This is powered by WebSocket technology and a custom time-synchronization protocol.

WebSocket Architecture

- FlashMan uses Socket.IO for persistent, bidirectional communication between host and all attendee devices
- Unlike HTTP requests (which are one-shot), WebSocket connections stay open — allowing the server to push commands to all devices instantly
- When a host presses FLASH, the command reaches all connected phones in under 150ms on a standard network
- The connection automatically reconnects if dropped, with no action required from attendees

Time Synchronization Protocol

Because different devices have different internal clocks, FlashMan runs a continuous time-sync protocol every 2 seconds. Each client calculates the difference between its local clock and the server's clock (accounting for network latency). Effects are scheduled with a 150ms future timestamp, giving all devices time to receive and execute the command at exactly the same moment.

Effect Broadcasting Flow

1. Host presses a button on the dashboard
2. FlashMan sends the effect command + a precise start timestamp to the server
3. Server instantly broadcasts the command to all devices in the event room
4. Each device calculates how many milliseconds remain until the start time
5. All devices execute the flashlight command at the exact same moment
6. Result: perfectly synchronized flash across the entire audience

Now Playing Broadcast

When the host starts playing a song, the song title is immediately broadcast to all connected attendees. A "Now Playing" banner appears on every attendee's screen showing the current song name — keeping the audience informed and engaged throughout the show.

Latency Performance

FlashMan achieves end-to-end effect latency of 50–200ms on standard Wi-Fi and mobile data networks, which is imperceptible to the human eye at a live event.

6. Host Dashboard & Controls

The Control Center

The Host Dashboard is designed for ease of use under pressure — during a live event, the host needs to act fast without confusion. Every control is large, clear, and one tap away.

Dashboard Sections

Event Identity Panel

- Displays the event name prominently at the top
- Shows the 9-character attendee PIN in large, readable text
- One-tap copy to clipboard for quick sharing
- "Show QR" button reveals the scannable QR code for the event
- Live connection status indicator (green = connected, latency in ms)

Participant Counter

- "Active Now" — number of attendees currently connected
- "Total Joined" — cumulative attendees who have joined this session
- Updates in real time as people join or disconnect

Live Effect Controls

- FLASH button — toggles torch ON/OFF with a single tap
- STROBE button — starts the strobe effect with a frequency slider (1–20 Hz)
- PULSE ONCE — sends a single brief flash to all devices
- STOP ALL — red emergency button that turns off every effect immediately

Music Sync Library

- Expandable/collapsible song sections for clean organization
- Upload interface for both audio and JSON timing files
- Song card with play, stop, preview, and delete buttons
- Live progress bar during playback
- Visual timing timeline with flash count display
- "Add Section" button to expand the library with more songs

Flashlight Permission Banner

If the host's device has not yet granted camera permission, a yellow warning banner appears at the top of the dashboard with a one-tap "Enable Flashlight" button. The event still works for all attendees even while the host resolves this.

7. Attendee Experience

Seamless Participation

The attendee experience is designed to be as simple as possible. An attendee should be able to join an event and have their flashlight active within 30 seconds of arriving at the venue, with zero technical knowledge required.

Joining the Event

1. Attendee opens their phone camera and scans the QR code shown on the projector screen
2. Browser opens automatically to the FlashMan join page with the PIN pre-filled
3. Attendee taps the Join button
4. Attendee is taken to the permission screen
5. Attendee taps "Enable Flashlight" and grants camera permission
6. Attendee is now live — their phone is part of the show

What Attendees See During the Show

- Black screen (maximizes battery life and reduces distraction)
- Event name and connection status in the top left
- "Standing By" indicator when no effect is active
- "Effect Active" with a pulsing animation when an effect is running
- "Now Playing" card showing the current song title when music is playing
- Screen lights up white when screen-flash fallback is active
- Exit button in the top right to leave the event

Flashlight vs Screen Flash

FlashMan supports two light output methods automatically:

Method	Used When	Effect
Hardware Torch	Device has a rear camera torch	Physical flashlight turns on/off
Screen Flash	No torch detected (front camera, desktop)	Full white screen flashes on/off
Auto Detection	Always	System chooses best method automatically

Safety Features

- Photosensitivity warning shown to all attendees before joining
- STOP ALL button on host side immediately halts all effects
- Screen wake lock keeps the screen on throughout the show
- Auto-cleanup when attendee leaves — torch turns off immediately

8. QR Code & Event Joining System

Instant Access for Audiences

Getting a large audience connected quickly is one of the biggest challenges for event technology. FlashMan solves this with its integrated QR code system — allowing hundreds of attendees to join in under a minute.

How the QR Code Works

- When the host creates an event, a unique QR code is automatically generated
- The QR encodes the full join URL with the event PIN pre-filled
- Attendees scan with their phone camera — no app, no typing
- Browser opens directly to the join confirmation screen
- One tap to confirm — attendee is live in the show

Displaying the QR Code

- Host taps "Show QR" on their dashboard to display the code
- The QR code can be screenshotted and shared via WhatsApp, email, or projector
- The host can also share the plain PIN for attendees who prefer to type
- Both methods work simultaneously — mixed joining is fully supported

PIN-Based Joining (Alternative)

For venues without a projector, or for pre-event sharing, the 9-character PIN works just as well. The PIN consists of 8 digits and 1 capital letter (e.g., 12345678A), making it unambiguous and easy to read aloud.

Event Security

Security Layer	Purpose
9-Character Attendee PIN	Unique per event — prevents random join-ins
Host Password (4 digits)	Required to re-access the host dashboard
Event ID (9 digits)	Used with password for host re-login
Host UUID	Internal token — not shared publicly
Session Tracking	Each device tracked as active/inactive

9. Multiple Event Management

Built for Professional Event Organizers

Professional event organizers run multiple events throughout the year. FlashMan is designed to support this workflow with its My Events system — allowing hosts to manage, access, and return to any of their past events from a single home screen.

My Events Feature

- Every event created is automatically saved to the host's device
- The home screen displays a list of all past events with name, PIN, and creation date
- One tap on any event reopens the full host dashboard for that event
- No login required — the device remembers all event credentials
- Old events can be removed from the list with one tap

Use Case Example

An event company that organizes weddings, corporate parties, and cricket watch parties can maintain a separate FlashMan event for each client. They switch between events instantly from their device — no re-setup, no re-login, no confusion.

Event Credentials System

Each event has four unique identifiers:

Credential	Format	Used For
Attendee PIN	8 digits + 1 letter	Audience joining
Event ID	9-digit number	Host re-login
Host Password	4 digits	Host re-login security
Host UUID	36-character UUID	Internal session tracking

Returning to an Event

If the host closes the browser or switches devices, they can return to any event by:

1. Opening FlashMan and selecting the event from "My Events" list (same device)
2. Using the "Host Login" option with Event ID + Password (any device)
3. The full music library, effects, and attendee history are preserved

Data Persistence

All event data including uploaded songs and timing files are stored in FlashMan's cloud database, meaning events and their full music libraries are accessible from any device at any time.

10. Flashlight & Screen Flash Technology

Making Every Phone a Light

FlashMan uses the WebRTC MediaTrack API — the same technology used by video calling apps — to access and control each phone's camera flashlight. This approach requires no app installation and works directly in the browser.

Physical Torch Control

- Browser requests access to the rear-facing camera using `getUserMedia()`
- Once permission is granted, the camera video track is captured
- The track's capabilities are checked for torch (flashlight) support
- When an effect fires, `applyConstraints({ torch: true/false })` is called
- The physical camera flashlight turns on or off within milliseconds
- The camera stream is kept alive silently in the background — the screen remains dark

Screen Flash Fallback

Not all devices support the torch constraint (e.g., front-facing cameras, older browsers, desktop computers). For these devices, FlashMan automatically uses a screen flash — filling the entire screen with white light at maximum brightness. This ensures every attendee participates in the show regardless of their device capabilities.

Auto-Detection Logic

1. Browser requests camera permission
2. FlashMan checks device capabilities for "torch" support
3. If torch is supported: physical flashlight is used
4. If torch is NOT supported: screen flash mode is activated automatically
5. Attendee never has to configure anything — it just works

Compatibility Results

Device Type	Torch Support	Fallback
Android (Chrome)	Full Support	N/A
iPhone (Safari)	Limited	Screen Flash
Desktop / Laptop	Not Supported	Screen Flash
Tablet	Varies by model	Screen Flash if unavailable

Note on iPhone

Apple restricts direct torch control via the web browser on iOS. iPhone users automatically get the screen flash experience, which is still visually impactful in a darkened venue.

11. Technical Architecture

Built to Scale

FlashMan is built on a modern, production-grade technology stack designed for high concurrency, low latency, and reliability.

Technology Stack

Layer	Technology	Purpose
Frontend	React 18 + TypeScript	User interface
Styling	Tailwind CSS + shadcn/ui	Design system
Animations	Framer Motion	Smooth transitions
State Management	TanStack Query	Server state & caching
Real-time	Socket.IO (WebSocket)	Live effect broadcasting
Backend	Node.js + Express	REST API + Socket server
Database ORM	Drizzle ORM	Type-safe DB operations
Database	PostgreSQL	Persistent data storage
Build Tool	Vite + esbuild	Fast build & hot reload
Hosting	Replit Cloud	Always-on deployment

Database Schema

Events Table

- id, pin, password, name, hostId, isActive, createdAt

Sessions Table

- id (socket ID), eventId, role, isActive, joinedAt, lastHeartbeat

Songs Table

- id, eventId, title, artist, url (base64), syncData (JSON), duration, createdAt

Scalability

The WebSocket architecture scales horizontally. Each event is contained in an isolated room — 100 events with 500 attendees each is just as responsive as a single event. Database queries are optimized with indexed lookups on PIN and hostId.

12. Security & Reliability

Built for Trust

Access Control

- Each event has a unique attendee PIN — brute force is impractical (billions of combinations)
- Host access requires both Event ID and 4-digit password — two-factor event ownership
- Only verified hosts (matching socket ID to event room) can broadcast effects
- Attendees cannot send any commands — they only receive
- All WebSocket commands are validated server-side before broadcasting

Connection Reliability

- Automatic reconnection — if a device loses connection, it silently reconnects
- No effect is missed — the last effect state is stored server-side and replayed on reconnect
- Time sync runs continuously — clock drift is corrected every 2 seconds
- Upload limit: 50MB per audio file with client-side pre-validation
- JSON validation on both client and server before saving timing data

Data Protection

- No personal data collected — attendees are anonymous
- No accounts, logins, or passwords required for attendees
- Host credentials stored only in the host's own browser (localStorage)
- All data transmitted over HTTPS in production
- PostgreSQL database with automated backups

Uptime & Performance

- Hosted on cloud infrastructure with 99.9% uptime SLA
- Effect broadcasting: < 200ms end-to-end latency
- File upload: validated and stored asynchronously
- Supports 500+ simultaneous attendees per event on standard infrastructure
- Zero downtime deployments with rolling updates

13. Device Compatibility

Works Everywhere

FlashMan is designed to work on virtually every device capable of running a modern web browser. No app download, no account creation, and no special hardware is required.

Supported Platforms

Platform	Browser	Torch	Screen Flash
Android 8+	Chrome 80+	' Yes	' Yes
Android 8+	Firefox	Limited	' Yes
iPhone iOS 14+	Safari	Partial	' Yes
iPhone iOS 14+	Chrome	No	' Yes
Windows Desktop	Any modern browser	No	' Yes
Mac Desktop	Safari / Chrome	No	' Yes
iPad / Tablet	Chrome / Safari	Varies	' Yes

Requirements for Attendees

- Any smartphone with a modern browser (Chrome, Safari, Firefox)
- Internet connection (Wi-Fi or mobile data — 2G is sufficient)
- Camera permission granted in the browser
- Screen at above 50% brightness recommended for screen flash mode

Requirements for Host

- Any smartphone, tablet, or laptop with a modern browser
- Stable internet connection (Wi-Fi strongly recommended for venue)
- For best torch results: Android device with Chrome browser
- For large events: consider a dedicated Wi-Fi network for attendees

Network Recommendations

- Wi-Fi: Any standard router — FlashMan uses minimal bandwidth per device
- Mobile Data: 3G/4G/5G — all work reliably
- Corporate/Venue firewalls: WebSocket port 443 must be open (standard HTTPS)
- For 500+ attendees: dedicated Wi-Fi access point recommended at venue

14. Target Market & Use Cases

Who Needs FlashMan

Primary Markets

Sports Events & Stadiums

Cricket, football, kabaddi — any sport with a passionate crowd. IPL matches, local tournaments, school sports days. Synchronized light waves during boundaries, wickets, or goals create unforgettable moments.

- IPL & cricket franchises
- Football clubs & federations
- Stadium management companies
- Sports event organizers

Entertainment & Nightlife

Pubs, clubs, music venues, and DJ events. FlashMan turns the audience into a living part of the light show, synchronized to the DJ's music.

- Pubs and bars
- Night clubs and lounges
- DJ events and music festivals
- Concert promoters

Weddings & Social Events

Wedding receptions, engagement parties, anniversary celebrations. The first dance light show, synchronized to the couple's chosen song, is a breathtaking moment using FlashMan.

- Wedding planners
- Event management companies
- Banquet hall operators
- Photography & videography teams

Corporate Events

Product launches, award ceremonies, annual days, town halls. FlashMan creates memorable moments that make corporate events feel extraordinary.

- Corporate event agencies
- HR & culture teams
- Conference organizers
- Brand activation companies

Education & Institutions

College fests, school annual days, cultural programs. Students love participatory technology — FlashMan makes every performance interactive.

-

College cultural committees

- School event organizers
- University fest organizers
- Youth associations

15. Business Models & Revenue

How FlashMan Makes Money

Model 1: Per-Event Licensing

Charge a flat fee for each event. Ideal for one-time buyers like wedding organizers or small clubs.

Event Size	Suggested Price
Up to 100 attendees	₹2,000 – ₹5,000 per event
Up to 500 attendees	₹5,000 – ₹12,000 per event
500+ attendees	₹12,000 – ₹30,000 per event

Model 2: Monthly Subscription

Unlimited events per month. Ideal for event companies that run multiple shows.

Plan	Events/Month	Price
Starter	3 events	₹4,999/month
Professional	15 events	₹14,999/month
Enterprise	Unlimited	₹29,999/month

Model 3: Full Product Sale

Sell the complete codebase and product to a single buyer who runs it as their own business.

Package	Includes	Price Range
Source Code Only	Full working codebase	₹1,50,000 – ₹3,00,000
Code + Setup	Code + 1 month support	₹3,00,000 – ₹6,00,000
White-Label	Custom branding + full code	₹5,00,000 – ₹15,00,000

Model 4: Franchise / Reseller

License the right to resell
FlashMan in a specific city
or region. Suitable for local
event tech companies who
want a ready-made product
to sell to their own clients.

16. Pricing Plans

Flexible Options for Every Buyer

STARTER

¹4,999 / month

- ' Up to 3 events per month
- ' Up to 200 attendees per event
- ' All live effects (Flash, Strobe, Pulse)
- ' Music Sync Library (up to 5 songs per event)
- ' QR Code joining
- ' Email support

PROFESSIONAL

¹14,999 / month

- ' Up to 15 events per month
- ' Up to 1,000 attendees per event
- ' All Starter features
- ' Unlimited songs per event
- ' Visual timing preview
- ' Multiple simultaneous events
- ' Priority support
- ' Analytics dashboard

ENTERPRISE

¹29,999 / month

- ' Unlimited events
- ' Unlimited attendees
- ' All Professional features
- ' Custom branding / white-label option
- ' Dedicated support manager
- ' Custom feature development
- ' SLA guarantee

' On-site setup assistance

17. Competitive Advantage

Why FlashMan Wins

Compared to Traditional Light Show Hardware

Feature	Hardware Light Show	FlashMan
Setup Cost	₹150,000 – ₹15,00,000	₹10 (uses existing phones)
Setup Time	2–8 hours	5 minutes
Equipment Needed	Lights, DMX, cables, technicians	Any smartphone
Scalability	Fixed number of fixtures	Unlimited phones
Crowd Participation	None — audience watches	Every attendee participates
Transport	Heavy equipment truck	Nothing — app is in the cloud

Compared to Other Crowd Apps

Feature	Other Apps	FlashMan
App Download Required	Yes — friction for attendees	No — browser only
Music Sync	Manual or basic beat detection	Custom JSON precision timing
Customization	Limited presets	Full creative control
Pricing	Per-seat or high monthly fees	Flexible, event-based
Multiple Events	Often one account = one event	Unlimited events, all saved

FlashMan's Unique Strengths

- Zero barrier to entry for attendees — no download, no account, just a PIN
- Music sync precision — millisecond-accurate timing via JSON files
- Works on any phone — physical torch or screen flash automatically
- Built for the Indian market — affordable pricing, mobile-first design
- Customizable per-event — each show can have its own full song library
- The host controls everything from a single screen — no technical staff needed

18. Roadmap & Future Features

What's Coming Next

Phase 2 — Planned Features

Color Flash Support

Extend the JSON format to include color: "color": "#FF0000" — allowing colored screen flashes for red/blue/green crowd effects. Different sections of the crowd can flash different colors simultaneously.

Audio Analysis Tool

A companion web tool where hosts upload a song and the system automatically generates a timing JSON file by detecting beats and drops in the audio.

Native Mobile App (iOS & Android)

A React Native app that provides better torch control on iOS and runs in the background — allowing attendees to use other apps without disconnecting.

Attendee Count Limits

Per-plan attendee limits enforced in the dashboard — enabling monetization by audience size for large-scale event operators.

Analytics Dashboard

Post-event reports showing peak attendance, effect usage, connection geography, and engagement metrics for corporate clients.

Ripple Effects

Zone-based crowd control — divide the stadium into sections and send different effects to different zones simultaneously, creating a "ripple" wave of light across the crowd.

Phase 3 — Vision

- Integration with professional lighting consoles (DMX bridge)
- Spotify / streaming service integration for automatic song detection
- Augmented reality effects using phone cameras
- Merchandise & ticketing integration for event companies
- White-label dashboard with full custom branding

19. Contact & Licensing

Let's Work Together

We are actively seeking licensing partners, white-label buyers, and early-adopter clients across India's event industry. FlashMan is a fully working product — not a concept. It has been developed, tested, and deployed and is ready to go live at your next event.

Licensing Options Available

- Per-event access for individual organizers
- Monthly subscription for event management companies
- Full source code purchase for independent deployment
- White-label branding for technology resellers
- City-level exclusivity partnerships for premium buyers
- Custom enterprise agreements for stadiums and large venues

What You Get With a License

- Full access to the FlashMan platform (web dashboard + attendee interface)
- Onboarding support and demonstration event
- Documentation for creating JSON timing files
- Technical support during your first 3 events
- Regular feature updates included in subscription plans

Get In Touch

Interested in licensing or purchasing FlashMan?

Reach out to discuss your event needs, request a live demo, or get a custom quote for your organization.

Product: FlashMan · Version: 1.0 · Ready to Deploy

FlashMan is more than a product — it is an experience. When 500 phones flash in perfect synchronization with a cricket six, or the first dance of a wedding glows in light, audiences remember it forever. Let FlashMan make your events legendary.
